

Management Summary (100 Words)

*During this assessment, multiple vulnerabilities were identified across the target systems, including SQL Injection, Cross-Site Scripting (XSS), and remote code execution risks. Automated and manual testing confirmed weaknesses in authentication, input validation, and session management. Exploitation demonstrated the potential for unauthorized access, privilege escalation, and sensitive data exposure. Each finding was validated, documented, and mapped to industry standards such as OWASP and PTES. Immediate remediation is recommended to mitigate exploitation risks. Suggested fixes include patching outdated services, implementing strict validation, enforcing secure authentication mechanisms, and conducting periodic security reviews. Overall system risk is classified as **High**.*
